Top 40 Issue List:

Add `quoted_time` for truncating the date part of a time column value

Context #24522.

TIME column on MariaDB doesn't ignore the date part of the string when it coerces to time.

...

root@localhost [test]

Run Action Cable callbacks through the worker pool

Alternate implementation of #24162 with tests. The code had diverged too far on master to pull that implementation directly.

Fixes #23778

Update ActiveRecord associations documentation on :validate option

Summary

Documentation on AR associations updated to

root@localhost [test]

Run Action Cable callbacks through the worker pool

Alternate implementation of #24162 with tests.
The code had diverged too far on master to pull that implementation directly.

Fixes #23778

Update ActiveRecord associations documentation on :validate option

Summary 

Documentation on AR associations updated to avoid confusion in regard to how `:validate` option works, and referring to `vali`

configurable token length

User Should be able to configure token length.
Suppose we can have multiple tokens (secret_key, secret_token) and we want secret_token to be

confusing usage of capitalized first

Update ActiveRecord associations
documentation on :validate option

rails-bot

Thanks for the pull request, and welcome! The Rails team is excited to review your changes, and you should hear from @matthewd (or someone else) soon.

If any changes to this PR are deemed necessary, please add them as extra commits. This ensures that the reviewer can see what has changed since they last reviewed the code. Due to the way GitHub handles out-of-date commits, this should also make it reasonably obvious what issues have or haven't been addressed. Large or tricky changes may require several passes of review and changes.

Please see [the contribution instructions] (http://edgeguides.rubyonrails.org/contributing_to_ruby_on_rails.html) for more information.

tomash

Also a question: while investigating aforementioned issue, I wrote two test cases demonstrating explicitly the difference between `:validate` and `validates_associated`. They are here:
<https://github.com/tomash/rails/commit/b701d92ba3d007087883360cd6b1356693f3afd6>
Should I include them in this PR?

WIP: Add Attributes API to release notes

maclover7

Overall looks pretty good :+1:

sgrif

Do we need this much detail in the release notes? It seems like this includes basically all of the documentation for the API.

vipulnsward

@sgrif no we don't. I need to condense 2 parts.

When ActiveRecord::Base.table_name_prefix/suffix

root@localhost [test]

Update ActiveRecord associations documentation on :validate option

Please see [the contribution instructions] (http://edgeguides.rubyonrails.org/contributing_to_ruby_on_rails.html) for more information.

tomash

Also a question: while investigating aforementioned issue, I wrote two test cases demonstrating explicitly the difference between `:validate` and `validates_associated`. They are here:

<https://github.com/tomash/rails/commit/b701d92ba3d007087883360cd6b1356693f3afd6>
Should I include them in this PR?

tomash

I have no idea why the build failed (other than the fact that jruby build was killed due to stalling).

maclover7

Can you squash and add `[ci skip]` to your commits?

tomash

Will do! Should I include the two new test cases in the squash?

confusing usage of capitalized first

ActiveRecord::Base.table_name_prefix /
suffix schema dumper allows for conflicts
with unprefix tables

other previous versions of Rails?

tomash

@maclover7 it's by design in Rails, at least
since 2012:
<https://github.com/rails/rails/commit/211dcdeaa922c74ac20d274308fb5d41ad490194>

@Empact since stripping application-wide
prefixes and suffixes exists in Rails for a
reason, namely to mitigate #4259, is adding
`def self.table_name_prefix` to specific
models (instead of application-wide prefix) a
suitable workaround for you?

vipulnsward

I think we can just warn for now. 2) means
we are missing out on information, that user
should no about.

tomash

2) sounds easier to implement and actually
closer to Rails intention (consistently not
being concerned about "outside" tables). Plus
a warning "we've detected N tables that don't
match configured prefix/suffix and therefore
will not be dumped into schema file". Does
that sound reasonable?

working properly
